Apr 3, 2011 you must be a student. i use . May 30, 2012 have a 'er 'n 'er' in your position on the. May 3, 2012 and not a defect in a problem's . May 2, 2012 a . I want to know whether the magnitude and location of maximum stress is correct, without doing an FEA simulation. I want to simulate only the rotor without the laminate, as the rotor is too heavy. A: The average maximum stress is in fact occurring in the middle of the disk. The von Mises stress is in the middle of the disk and the tangential stress is in the edge of the disk. That's the way a beam/plate member should work. The stress is always in the middle of the member. With the thick plate, the stress in the middle is big, but it is not the point of failure. Since the stresses are concentrated at the edge, you'd probably crack the plate in the middle. You can solve the problem by reducing the stress in the middle. To do that, remove the stress in the middle by making a hole through the thickness of the plate. Do that so the stresses in the middle is even larger. That is the way a beam/plate should work. Q: Is it possible to change chart title in QlikView Is it possible to change chart title in QlikView? A: QlikView uses tool tip to render any chart title, so you can't change it. You should add text to an axis with the same placement and format as the title. If you want the text not to be wrapped, you should use html tag instead of text. A: You can change the 'Tooltip' for each chart. First, go to 'Data properties'. Go to 'Chart Title' and change the tooltip and other properties. Q: Why does Collection count change after long time? I was performing a certain operation on an ArrayList. The ArrayList was of type java.util.Collection. After finishing the operation, I was checking for some reasons. The number of elements in the ArrayList was 512. I was expecting that ArrayList would have 512 elements and the elements would be added and removed while performing 4bc0debe42
