The tool even allows for currency conversion using words and supports 32 fiat currencies. Additionally, Parsify will make working with percentages much easier as it allows using a simple syntax such as 'x% of total'. Identifying timezones, locations' current time, defining and predicting future events' dates in a clean, easy-to-learn format, has never been easier e.g. 'two weeks from today' will output the exact date. It can equally identify, based on user input, the exact date from the current moment. Custom features and clear documentation When it comes to customizations and flexibility, Parsify manages to overdeliver. For all calculations one must do, the app allows for custom unit creation the unit's name, value definition, and alternative aliases you might want to use. Creating and installing your custom-made plugins is also possible. All of these options, the advantages, differences between the free and the paid version are beautifully detailed in a neatly crafted documentation. It's available through Settings > General > Accessibility > Calculator. If you need a more custom solution, you can always create a UITextField in Interface Builder or programmatically and then add an InputView, as described in this answer. A: There is no standard calculator app. A standard calculator app will be a very complicated app to write. I suggest that you create a web page that you will launch from the app. Then use javascript and ios's inbuilt web browser and javascript access to get at the browser's calculator. You can either use a web-based calculator or write one in c/c++ and just run it in the app and communicate to the web browser using a local socket/network socket [Psychodynamic psychiatry in the US: an institutional history]. This article is based on the book "Psychodynamic Psychiatry in the United States: An Institutional History," which is scheduled for publication in late 2011 by Routledge/Taylor and Francis. An institutional history of "psychodynamic psychiatry" in the United States is presented. The development of "psychodynamic psychiatry" in the United States is traced from the period of the Berlin Psychoanalytic Institute, which was launched in 1924, to its demise in the wake of the rising "antipsychiatry" movement, which culminated in the founding of the National Institute of Mental Health (NIMH) in 1972.Q: Accessing parent's variable in IIFE when using ES6 modules Below is code in my app.

This file shows the difference of view depending on one or more SQL statements. What I need is to help to open it and to view it. A: Try AppDiff. It's a third-party diff tool for Windows. The free version works fine for your purposes. A: You can also try SSM View Diff. This one provides some additional features. For example, you can specify whether the differences should be considered ignored (i.e., a difference at the end of a file is ignored, while a change in the middle of the same line is not) or marked as relevant (a difference at the end of a line is considered a change, while a change in the middle of a line is not). . However, PD has also been reported to occur in response to a number of diseases and inflammatory states, making differentiation of drug-induced PD from PD associated with other etiologies challenging.^[@R28]^ It is also noteworthy that in all of the cases reported herein, PD occurred within 24 hours of starting the medications; this short latency is extremely unusual and suggests a strong causal relationship between the medications and PD. The median age of all cases was 48 years, which is much younger than what has been previously reported. This could be because our patients tend to present with the disease in its early stages, or possibly because we consider patients with PD to be younger than those with PD previously reported, resulting in fewer cases of PD reported. All patients were considered to have idiopathic PD, but the natural history of PD is well known to vary based on risk factors.^[@R29],[@R30]^ Other studies also suggest that genetic predisposition may play a role in the development of PD.^[@R31],[@R32]^ The notion of genetic predisposition for PD is supported by the occurrence of PD in association with mutations in the *SNCA* gene,^[@R33]^ which encodes for the α-synuclein protein. Further, the observation that the median age of onset of PD is younger in African Americans^[@R34]^ provides additional evidence to support the notion that race/ethnicity may play a role in PD development. There were 7 cases of PD associated with *D. mauritianum*, 3 of which had a PD diagnosis within 72 hours of starting the medication,
